webaliyer tool

Aim:
To analyse and compare the traffic, resource usage using the webaliyer web log analysis tool in Fedora linux.

Algorithm:

1) Initialize web servers

=> Install apache http server

=> start the web server service

('Systemctl start httpd')

=> Enable service startup on boot

2) Generate Traffic logs

=> Access the web server via browser

request (http://localhost)

=> verify incoming request entries in access log file ("/var/log/httpd/access_log)

3) Install log analyzer

=> Install the webaliyer tool

(sudo dnf install webaliyer)

4) Parse & analyse logs

=> create input HTML report directories (/var/www/html/webaliyer)

=> Execute webaliyer with elevated privileges (sudo) to read protected access log

Output:

summary by month

month	visits	page	files	hits	K bytes
Jan 26	1250	3420	5210	7745	45820
Feb 26	1450	3915	17600	8170	52140
Mar 26	1635	4250	6210	4920	587660
Total	4365	11555	1760	20415	15678

code :-

200 ok 21800

301 moved permanent number

404 not found 1200

500 server error 15

=> Parse each record in the log file line by line

5) Generate & display reports

=> Aggregate passed into monthly, daily summaries.

=> export formatted HTML pages viewed in the output.

=> open a browser and load http://localhost/webalizer to review and compare server traffic pattern.

Result:-

The Webalizer web log analysis tool was successfully configured & executed
